

AI with Rav

Learn AI the way you actually think.

DAY 1 of 30

HACKATHONS

What a Razorpay hackathon actually asks you

WHAT YOU'LL LEARN TODAY

- > What the brief really was
- > The agent app I shipped
- > The one question that decides the winner
- > What I would do differently

What a Razorpay hackathon actually asks you

In One Line: The demo does not win a hackathon. The five minutes of questions after the demo wins it.

The room

Razorpay and Replit ran an AI Buildathon at the PayPal office.

Build something with AI agents. Show it working. Then defend it.

I took **Agentic Growth OS** — five agents that plan an ad campaign end to end.

One picks the audience. One writes the copy. One splits the budget. One assembles the campaign. One scores what came out.

ONE CAMPAIGN BRIEF → FIVE SPECIALISTS → ONE SCORED RESULT

state passes forward — each agent adds to it

Every number the last agent prints is a **PROJECTION** — labelled, seeded, and shown with its formula

Five specialist agents, each doing one job, passing work down the line

The part nobody prepares for

Everyone can demo. The screen moves, the numbers appear, it looks alive.

Then a judge asks one question:

"Where did that number come from?"

That is the whole hackathon. Not the UI. Not the framework. That one question.

What I found in my own app

My app printed a confident **+6.2% improvement**.

I opened the code. The metric was `random.uniform()` against a hardcoded table. Two identical runs gave **+1.84x** and then **+0.55x**. Same input. Different answer. The improvement was noise wearing a percentage sign.

What I changed

I seeded the numbers from the campaign itself — same input, same output, every time. I added the missing step in the funnel: a click becomes a *lead*, and only some leads become sales. And I labelled the whole panel **Projected — simulation model v1**, with the formula one click away.

Honest and checkable beats impressive and vague. Every time.

The lesson

Judges are not testing your demo. They are testing whether you know what your own system is doing.

If a number on your screen is a guess, say it is a guess — and show the formula. That answer is stronger than any animation.

Next video: the five-agent pattern, and when you should NOT use agents.
