

AI with Rav

Learn AI the way you actually think.

DAY 7 of 30

HACKATHONS

Ship the honest version

WHAT YOU'LL LEARN TODAY

- › Why honesty wins the Q&A
- › The label that saves you
- › What to document
- › The one-line test before you demo

Ship the honest version

In One Line: You do not need real data to win. You need to be exactly clear about what your data is.

The fear, and why it is wrong

Everyone worries that admitting "this is simulated" kills the demo.

It does the opposite. Unlabelled numbers invite the question *"is this real?"* —

and once that question is in the room, nothing you say afterwards lands.

A label answers it before it is asked.

What I put on the screen

One strip above every result:

- **Projected — simulation model v1** — what kind of number this is
- **Deterministic — same input, same output** — it is checkable
- **Ad copy: template library** — which part is real, which is not
- **Show formula** — a click reveals the actual maths

What I wrote down

A **MODEL.md** with a table: orchestration real, learning loop real,

performance metrics simulated, ad platform not implemented.

Plus the formula, the assumptions, and a "known limits" section I wrote myself.

Writing your own limits section is the strongest move available. Nobody can expose what you already published.

The test before you demo

Point at the biggest number on your screen and finish this sentence out loud:

"That number comes from ____, and I can show you the line of code."

If you cannot finish it, fix that before you touch the CSS.

That is the playlist. Build the thing, then be the person who knows exactly what it does.
