

99% accurate. Catches zero fraud.

THE MODEL THAT ALWAYS SAYS "NOT FRAUD"

ACCURACY

99%

FRAUD CAUGHT

0%

- 1 1,000 transactions. 10 are fraud. Predict 'not fraud' every single time.
- 2 Accuracy: **99%**. Fraud caught: **zero**. The model learned nothing.
- 3 **Recall** asks the real question: of all the fraud, how much did I catch?

REMEMBER THIS

On imbalanced data, accuracy makes a useless model look excellent.
