

Your model will get worse on its own

NOTHING IN THE CODE CHANGED

No error. No crash. No alert.

Same model, shifting world, falling accuracy

Nothing in the code changed. The **world** changed. That is data drift.

- 1 A model trained on 2023 shopping habits meets 2026 shoppers.
- 2 Accuracy falls quietly — no error, no crash, no alert.
- 3 You only find out when someone complains about the results.

REMEMBER

Monitor the inputs, not just uptime. Drift is silent by nature.
