

99% accurate and useless

THE MODEL THAT ALWAYS SAYS "NOT FRAUD"

ACCURACY

99%

FRAUD CAUGHT

0%

990 right, 10 missed — and the 10 were the point

If 99 of 100 transactions are genuine, saying 'genuine' every time is 99% accurate.

- 1 That model catches **zero** fraud. It has learned nothing.
- 2 **Recall** asks: of all the real fraud, how much did I catch? Here, none.
- 3 Accuracy hid it because 990 easy answers drowned 10 expensive mistakes.

REMEMBER

On imbalanced data, accuracy is the metric that makes a useless model look excellent.
