

AI with Rav

Learn AI the way you actually think.

DAY 4 of 30

AI CAREERS

Why "I know Python" is not enough

WHAT YOU'LL LEARN TODAY

- > What companies actually screen for
- > The three-layer skill stack
- > Where most developers stop
- > What to build instead

Why "I know Python" is not enough

In One Line: Every AI job posting asks for Python. None of them are hiring you for Python.

The honest picture

Python is the **keyboard**, not the job. Saying you know Python is like a carpenter saying he owns a hammer.

Companies hire for three layers. Most developers stop at the first.

Everyone has layer 1. Layer 3 is where the job offers are.

Layer 1 — the tools

Python, an API call, a notebook that runs. Genuinely necessary. Also what everyone applying has.

Layer 2 — the judgement

Which model, and why. When retrieval beats fine-tuning. What your system does when the model returns nonsense.

This is where the interview actually happens.

Layer 3 — the evidence

Something running that someone other than you has used. A repo with a README

that explains the trade-offs you chose and what you would do differently.

One deployed project you can defend in detail beats ten tutorials you followed.

What to do this month

Pick one real problem. Build the smallest version that works. Deploy it. Write down honestly what it does badly.

That last document — the honest one — is the strongest thing in an AI portfolio. Almost nobody writes it.
