

Attention lets every word **look at every other word** before deciding what it means.

THE SAME WORD, PULLED TWO WAYS

The bank was steep

river

The bank was closed

money

Attention weights which neighbours matter

- 1 'The **bank** was steep' and 'The **bank** was closed' — same word, different meaning.
- 2 The model reads the whole sentence and **weights** which other words matter.
- 3 'Steep' pulls *bank* toward the river. 'Closed' pulls it toward money.

REMEMBER THIS

That weighting is attention. It is why context finally worked.
