

If you can **draw the steps on paper** before running it, you need a function, not an agent.

PIPELINE

always the same path

AGENT

chooses based on what came back

- 1 An agent is a model that **decides what to do next**. That is the whole definition.
- 2 Fixed order every time? That is a pipeline with extra billing.
- 3 Agents earn their cost when the next step **depends on what came back**.

REMEMBER THIS

Most 'agent' demos are for-loops. Know which one you are building.
