

A chain is just a pipeline

CHAIN

Output of one step feeds the next

LangChain's core idea is small: **the output of one step is the input of the next.**

- 1 Prompt → model → parse → next prompt. Nothing magical.
- 2 The value is the **plumbing**: retries, parsing, swapping models.
- 3 You can write this yourself. The library saves the boring parts.

REMEMBER

Learn the pattern, not the library. The pattern outlives every framework.
