

Cache the expensive thing, not everything

Slow and repeated is worth caching; nothing else is

A cache is a bet: **this will be asked again**. Bet wrong and you have added complexity for nothing.

- 1 Cache what is **slow to compute** and **often repeated**.
- 2 Never cache what changes per user per second — you pay the cost, never the benefit.
- 3 Every cache needs an answer to: **when does this become wrong?**

REMEMBER

If you cannot say when an entry goes stale, you are not ready to cache it.
