

A graph lets the agent go backwards

GRAPH

the loop back is what a chain cannot do

One direction versus a loop that can retry

A chain only moves forward. A **graph** can loop back and try again.

- 1 Chain: prompt → model → answer. One direction, always.
- 2 Graph: if the answer fails a check, **route back** and retry differently.
- 3 That loop is what makes 'agentic' behaviour possible at all.

REMEMBER

If your flow never needs to go back, you do not need a graph yet.
